

# GNU Guix Reference Card

for version 1.4.0  
<https://guix.gnu.org/>

## Getting Started

To read the on-line documentation run `info guix` or visit  
<https://guix.gnu.org/manual/>. See <https://emacs-guix.gitlab.io/website/> for an Emacs interface to Guix.

## Specifying Packages

Most commands take a “package specification” denoted `spec` in the sequel. Here are some examples:

```
emacs
gcc-toolchain@7
gcc-toolchain:debug
emacs package, latest version
GCC toolchain, version 7.x
latest GCC toolchain, debugging symbols
```

## One-Off Environments

	Customizing Packages	Developing Packages
<code>guix shell spec...</code>	environment containing <code>spec...</code>	view the definition
<code>guix shell -D python</code>	environment to develop Python itself	build packages
<code>guix shell python -C -- python3</code>	run Python in a container	view the build log
<code>guix shell --check</code>	check if the shell clobbers environment variables	build packages, keep build trees on failure
<code>guix shell -m file</code>	create an environment for the packages in manifest <code>file</code>	obtain the source of <code>spec</code>
		rebuild a package
		cross-compile to <i>triplet</i> —e.g., <code>arm-linux-gnuabihf</code>
		download from <code>URL</code> and print its SHA256 hash
		print the hash of <code>file</code>
		view dependencies
		update package definition
		import name from <code>repo</code>

## Managing Packages

```
guix search regexp ...
guix show spec...
guix install spec...
guix upgrade [regexp]
guix remove name...
guix package -m file
guix package --export manifest
guix package --roll-back
guix package -I
guix package --search-paths
guix package -P profile ...
```

search for packages  
show package info  
install packages  
upgrade packages  
remove packages  
instantiate from manifest  
export profile contents as  
manifest  
roll back  
list installed packages  
list profile generations  
display search paths  
use a different profile

## Using a Different Version of Guix

The `guix time-machine` command provides access to other revisions of Guix, for example to install older versions of packages, or to reproduce a computation in an identical environment.

```
guix time-machine -C file -- commands ...
Run commands in a version of Guix specified by the given
channels in file
```

(`specifications->manifest`,  
(`"gcc-toolchain@7"` "gcc-toolchain@7.debug"  
"opemppi")  
)

`guix time-machine -C file -- commands ...`  
Run commands in a version of Guix specified by the given  
channels in `file`

## Creating Application Bundles

### Declaring an Operating System

```
guix pack spec ...
guix pack -f docker spec ...
guix pack -f squashfs spec ...
guix pack -f deb spec ...
guix pack -RR spec ...
guix pack -S /bin=bin spec ...
guix pack -m file

create a tarball
create a Docker image
create a Singularity image
create a Debian package archive
create a relocatable tarball
make/bin a symlink to the packages'bin directory
bundle the packages from the manifest in file
```

### Managing Storage Space

```
guix gc
guix gc -C nG
guix gc -F nG
guix gc -d duration

collect all garbage
collect n GB of garbage
ensure n GB are available
delete generations older than duration—e.g., 1m for one month
view package size
list run-time dependencies
view run-time dependencies
```

### Building Operating Systems

```
guix system takes a configuration file that declares the complete
configuration of an operating system, along these lines:

(use-modules (gnu)
  (use-service-modules networking ssh)
  (use-package-modules certs screen))

(operating-system
  (host-name "gnu")
  (timezone "Europe/Berlin")
  (locale "en_US.utf8")
  (keyboard-layout (keyboard-layout "us" "altgr-intl"))

  (bootloader (bootloader-configuration
    (bootloader grub-fifi-bootloader)
    (target (list "/boot/efi"))
    (keyboard-layout keyboard-layout)))
  (file-systems (cons (file-system
    (device (file-system-label "my-root"))
    (mount-point "/")
    (type "ext4"))
    %base-file-systems))

  (users (cons (user-account
    (name "charlie")
    (comment "Charlie Smith")
    (group "users")
    (supplementary-groups ('"wheel"!
      "audio" "video")))
    %base-user-accounts)))
    %base-user-accounts))

  ;; Globally installed packages.
  (packages (append (list screen nss-certs)
    %base-packages))

  ;; System services: add ssd and DHCP to the base services.
  (services (append (list (service dhcp-client-service-type)
    (service openssh-service-type
      (openssh-configuration
        (port-number 2222)))
    %base-services)))
```

### Managing the Home Environment

```
guix home takes a configuration file that declares dotfiles, packages,
and user services.
```

```
guix home search regexp
search for services matching regexp
guix home reconfigure file
reconfigure the home according to the configuration in file
guix home list-generations [pattern]
list home generations matching pattern
guix home delete-generations matching pattern
roll back to the previous generation
guix home build file
build the home environment declared in file
```

### Managing the Operating System

```
guix system image file
  create a raw disk image for the OS declared in file
guix system image --image-type=iso9660 file
  create an ISO CD/DVD image for the OS declared in file
guix system image --image-type=qcow2 file
  produce a QCOW2 image of the OS in file
guix system vm file
  produce a script that runs the OS declared in file in a VM

guix system search regexp
  search for services matching regexp
guix system reconfigure file
  reconfigure the OS according to the configuration in file
guix system list-generations [pattern]
  list OS generations matching pattern—e.g., 1m for one month
guix system roll-back
  roll back to the previous system generation
guix system delete-generations pattern
  delete generations matching pattern
guix system build file
  build the OS declared in file
```

### Building and Running Containers

```
guix system container file
  produce a script that runs the OS declared in file in a container
guix system docker-image file
  build a Docker image of the OS declared in file
```

### Inspecting an Operating System

```
guix system extension-graph file
  show the graph of services extensions for the OS in file
guix system shepherd-graph file
  show the dependency graph of Shepherd services for file
```
